Integrity Laboratories, LLC Announces Monkeypox Test Validation

Knoxville— 06/24/2022 — Integrity Laboratories, LLC has completed the validation of the Monkeypox virus PCR test, and it is available for immediate order by clinicians. “We are pleased to lead the infectious diseases field once again in the timely validation and availability of this addition to our Lesion Dx™ menu via our Laboratory Developed Test (LDT) process.” said Christian Clevenger, CEO at Integrity Laboratories.

It is about *TIME*

According to the Center for Disease Control, the Monkeypox virus can be spread via direct skin-to-skin contact as well as respiratory secretions¹. The possibility of transmission from those who have yet to display symptoms is still unknown, therefore timely and accurate testing is critical. “The sensitivity (LoD) for detection of the Monkeypox virus by our LDT is 10cp/uL with 100% specificity,” said Clevenger, “and we are ready to provide highly accurate results for requisitioned tests within 24-28 hours of specimen receipt utilizing our DNA-based PCR platform.”

Founded in 2004 in Knoxville, TN, Integrity Laboratories, LLC utilizes its proprietary intercept PCR™ platform to test for a wide range of bacterial and viral health issues, including women’s health, wound care, gastrointestinal, lesions, respiratory, UTI, STI, and HPV detection.
